

VELVET

Clothing Website

Project Documentation

© 2026 VELVET — All Rights Reserved

1. Introduction

Velvet is an online clothing website designed to provide users with a smooth and elegant shopping experience. The platform allows users to browse different categories such as shirts, pants, dresses, and skirts, view product details, and explore a visually appealing catalog. Built with a warm, premium aesthetic, the site reflects the brand's philosophy: that what you wear is an extension of your soul.

2. Objectives

- Create a modern and user-friendly clothing website
- Display products in an organized, visually compelling way
- Allow easy navigation between product categories
- Provide a visually attractive interface aligned with the Velvet brand identity
- Communicate brand values through dedicated About and Contact pages

3. System Overview

Type: E-commerce (front-end website)

Users: Customers — anyone browsing or purchasing clothing

Main Features

- Browse and view products with images, names, and prices
- Filter products by category (Pants, Shirts, Dresses, Skirts)
- Read brand story and mission on the About Us page
- Send inquiries through the Contact Us form
- Access store hours and social media links from every page

4. System Design

The website is organized into four main pages, each serving a distinct purpose in the customer journey. The interface design follows a consistent warm beige palette with dark brown typography, Cormorant Garamond-style display fonts, and clean product cards composed of an image, name, short description, and price. Below is an overview of each page.

4.1 The Main Page — Brand Entrance & Navigation

Figure 1: The Main Page (Homepage)

Homepage with hero section, category cards, brand stats, and footer

This page acts as the digital storefront designed to establish the brand's Velvet identity and high-end positioning. Its primary function is to provide an immediate visual hook while offering clear entry points into specific product categories through a high-level navigation menu and category cards. The hero section welcomes users with the brand tagline, while the stat counters (15 Years, 500+ Designs, 100% Premium Quality) reinforce credibility. A founder card anchors the brand's personal voice.

4.2 The Catalog Page — Product Selection & Decision Making

Figure 2: The Catalog Page

Catalog grid with sidebar category filter, product images, names, and pricing

The catalog serves as the functional heart of the e-commerce experience, where the user moves from browsing to selection. It is designed for clarity and comparison, utilizing a clean grid and sidebar to help users filter through styles, view pricing, and find items that meet their specific needs. Each product card features a full-bleed image, product name, brief description, and price — giving users everything they need to make a confident purchase decision without unnecessary clutter.

4.3 The About Us Page — Brand Authority & Trust

Figure 3: The About Us Page

Four-pillar brand story: Who We Are, Our Mission, Why Choose Us, Our Vision

This page is dedicated to building a relationship with the consumer by outlining the "Four Pillars" of the business: mission, vision, quality, and identity. It is intended to justify the premium nature of the products by explaining the craftsmanship and philosophy behind the brand. Each pillar is presented in a clearly defined card, making the content scannable and authoritative. The tone reinforces Velvet as more than a store — it is a lifestyle and a commitment to excellence.

4.4 The Contact Us Page — Engagement & Support

Contact form with full name, email, phone, subject, and message fields

The contact page is the final touchpoint for customer service and personalized inquiries. It is designed to provide accessibility and transparency, offering a direct communication channel that reduces purchase anxiety by showing the brand is reachable and professional. Alongside the form, store hours and social media links are displayed, reinforcing the brand's openness and multi-channel presence. The layout pairs functionality with the same warm aesthetic found throughout the site.

5. Implementation

Technologies Used

- HTML5 — Page structure and content markup
- CSS3 — Styling, layout (Flexbox/Grid), animations, and responsive design
- JavaScript — Category filtering, form interactions, and dynamic UI elements

The website was built using HTML for structure and CSS for styling. Different sections such as shirts, pants, dresses, and skirts were organized into separate parts of the catalog page and toggled via JavaScript. A consistent design language was maintained across all pages using shared CSS variables for colors, fonts, and spacing.

6. Testing

- Verified all product images display correctly across all catalog sections
- Tested navigation links between all four pages
- Confirmed category sidebar filters products accurately
- Validated contact form fields and submit button behavior
- Checked footer links and schedule information for consistency
- Tested responsiveness across different screen sizes

7. Challenges

- Images not displaying properly due to incorrect file path references
- Product sections overriding each other when filtering by category
- Layout inconsistencies between the catalog sidebar and the product grid
- Maintaining consistent font rendering for display and body typefaces
- Ensuring the footer content remained aligned across varying page lengths

8. Conclusion

The Velvet website successfully demonstrates a fully functional front-end clothing catalog with a refined, premium design. All four pages work cohesively to guide the user through a complete brand experience — from discovery on the homepage to product selection in the catalog, brand trust through the About page, and direct engagement via the Contact form.

Future improvements could include adding a shopping cart, a user login and account system, backend integration for order processing, and a fully responsive mobile layout.
